ALBERTO NÚÑEZ TREJOS

+506 8510 9300 — albertone448@gmail.com — Alajuela, Costa Rica
linkedin.com/in/albertone448 — github.com/albertone448 — Portfolio: alberto-nuneztrejos.vercel.app

Professional Profile

Systems Engineer focused on software development and data analysis. Completed two professional internships building web applications with React, PHP, and MySQL, in Agile teams using Jira, Git, and pull requests. Independently built a full stack app a family business uses daily, is building a .NET and PostgreSQL app, and published two statistical analyses (Pearson correlation, ANOVA) as Tableau dashboards using Python, Pandas, and SciPy. Comfortable across the full pipeline, from writing the code that generates data to querying, testing, and visualizing it. Bilingual in Spanish and English.

Work Experience

Frontend Developer, Professional Internship · **Grupo Eulalia** *Remote*

July 2025 – December 2025

- Built a React.js work order module for a truck repair workshop, turning basic inventory transactions into a full maintenance management system with complete tracking from incident report to job completion.
- Enabled analytics not possible before, including cost analysis per vehicle, mechanic efficiency evaluation, and failure pattern identification, tracking more than 30 active vehicles with full maintenance history.
- Automated the cost calculation process and built a driver incident reporting interface, giving management real-time per-job costs and cutting maintenance decision response time by 40%.
- Reached more than 85% code coverage on React components with Jest, and used Jira and Bitbucket for Agile task management and version control.

Full-Stack Developer, Professional Internship · **Ticotek** *Remote*

January 2024 – June 2025

- Built a shipment control system from the ground up for a technology retail store, covering deliveries, drivers, vehicles, and payment tracking with full traceability.
- Designed a normalized MySQL schema and a PHP REST API for orders, deliveries, drivers, and vehicles, cutting average query time by 60% and reaching 99% uptime during testing.
- Replaced manual reporting with a self-service system, saving more than 15 hours of operational work weekly, and automated critical workflow testing with Selenium, reaching more than 95% reliability before deployment.
- Built a responsive React front end supporting real-time monitoring of more than 50 weekly deliveries, and set up a Git branching and pull request workflow with a 5-person team.

Customer Service Representative · **Foundever** *Heredia, Costa Rica*

August 2021 – February 2023

- Gave bilingual (English and Spanish) support for a major bank's credit card department, handling more than 50 daily account inquiries, disputes, and technical issues.
- Resolved complex billing disputes and fraud cases, reaching a 92% first-call resolution rate and a 4.7 out of 5 customer satisfaction score, while cutting average resolution time by 20%.
- Trained 5 new team members on service protocols, dispute resolution, and banking systems.

Personal Projects

Store Credit Management System · **Personal Project (Family Business)**

Built and deployed a full stack web app to replace a paper credit ledger used daily by a family grocery store, still in active use.

- Designed a real-time system with Firebase Realtime Database and a PIN-based profile system, giving full traceability of who created or edited every entry.
- Built a Node.js service that listens for database changes and sends WhatsApp and email alerts on each transaction.
- Deployed on Vercel with continuous deployment from GitHub, running entirely on free-tier infrastructure.

Tech: React, Vite, Firebase (Realtime Database, Authentication), Node.js, Vercel

Batazo · Personal Project (In Progress)

Web app for private football prediction pools, covering international leagues and Costa Rica's top division, where friends predict match scores and compete on a leaderboard with points for exact score, goal difference, or result.

- Built a layered ASP.NET Core API (domain, infrastructure, API, and unit tests) on PostgreSQL with Entity Framework Core migrations, a unified ProblemDetails error contract, input validation, and structured JSON logging.
- Injected the clock through TimeProvider and enforced it with a code analyzer, so time-dependent rules are unit testable.
- Set up GitHub Actions CI as a required merge check, with automatic deployment to Render and Neon via Docker.

Tech: C#, .NET 10, ASP.NET Core, Entity Framework Core, PostgreSQL, React, TypeScript, Vite, TanStack Query, Docker, GitHub Actions, Render, Neon

Messi: Outlier · Personal Data Analysis Project

Statistical analysis of how singular Messi's World Cup profile is, measured against the full population of 5,636 historical World Cup outfield players (1966–2026).

- Built a full extraction pipeline scraping match-level stats for 900 World Cup matches through SofaScore's internal API, validated against known historical matches before running the full extraction.
- Defined 16 metrics across four functional player roles (finisher, dribbler, chance creator, play organizer), normalized per 90 minutes, and tested elite status at multiple percentile thresholds instead of committing to one cutoff.
- Found that no player reaches elite status in all four roles at a genuine threshold, and that Messi holds the highest average role percentile among players with a real career-length sample, at every threshold tested.
- Published the findings as a 3-part interactive Tableau Public dashboard.

Tech: Python, Pandas, Jupyter Notebook, Matplotlib, ScraperFC, Tableau Public

Always Barça · Personal Data Analysis Project

Statistical analysis of 33 seasons of FC Barcelona (1993/94–2025/26), testing whether transfer spending or coaching decisions better predict sporting performance.

- Consolidated performance, spending, coaching, academy usage, squad value, and presidency data from multiple sources, including manual data collection and cross-validation where automated coverage did not exist.
- Tested five variables with Pearson correlation and ANOVA, finding that coaching and squad market value explain performance significantly while transfer spending and academy usage do not, shown in four linked Tableau dashboards.

Tech: Python, Pandas, Jupyter Notebook, BeautifulSoup, SciPy, Tableau Public

Education

Universidad Nacional de Costa Rica

- Bachelor in Systems Engineering
- Diploma in Application Programming
- Relevant coursework: Operating Systems, Computer Networks, Data Structures, Databases, Software Engineering

Skills

Programming & Development: JavaScript (React.js, Node.js), TypeScript, C# (.NET, ASP.NET Core, Entity Framework Core), PHP, Java (Spring Boot), Python, HTML, CSS, RESTful APIs, Firebase, responsive design

Databases: SQL Server, MySQL, and PostgreSQL (T-SQL, stored procedures, schema design, query optimization)

Testing: Jest, Selenium, PHPUnit, unit and integration testing, TDD practices

Tools & Methods: Git (GitHub, Bitbucket), GitHub Actions, Docker, Jira, Agile/Scrum

Data Analysis: Python (Pandas, Matplotlib, SciPy), SQL, Jupyter Notebook, Tableau, statistical analysis and hypothesis testing (Pearson correlation, ANOVA), data cleaning and validation, data extraction (BeautifulSoup, ScraperFC)

Languages: Spanish (Native), English (C1, Advanced)
